

ABSTRACT OF THE DISCLOSURE

1
2 A tall tower is divided into an upper section with a tower top and a lower section with a
3 tower bottom. The sections are hinged together. The lower section is hinged to a tower
4 base. A telescoping crane is attached to a lift point on the lower section. The crane is
5 extended to lift the sections to the vertical position with the lower section resting on the
6 base and the tower top of the upper section near ground level. A heavy load is attached to
7 the tower top end using a small ground crane while the tower top of the upper section is
8 near ground level. The telescoping crane is attached to another lift point on the upper
9 section to partially lift the upper section, which is supported in this position. The
10 telescoping crane is relocated and reattached to the lift point on the upper section. The
11 telescoping crane is fully extended to raise the upper section and load to vertical above
12 the lower section.
